Practical 11

Develop a windows form application to divide two numbers with try catch block for DivideByZeroException .

The screenshot shows a Windows Form application titled 'Form1'. The form has a light gray background and a title bar with standard Windows window controls. The main content area is titled 'Simple calculator' in a large, bold, black font. Below the title, there are two text boxes for input, labeled 'First Number' and 'Second Number'. To the right of these text boxes is a panel titled 'Select Operator' which contains four radio buttons: 'Addition', 'Subtract', 'Divide', and 'Multiply'. Below the text boxes is a 'Compute' button. The form is designed to perform a calculation based on the user's input and the selected operator.

Add controls (label ,Textboxes ,Radio Buttons ,panel and Button)

Source Code:

```
using System.Globalization;

namespace trycatch
{
    public partial class Form1 : Form
    {
        public Form1()
        {
            InitializeComponent();
        }

        private void button1_Click(object sender, EventArgs e)
        {
            int i = int.Parse(textBox1.Text);
            int j = int.Parse(textBox2.Text);

            if (radioButton_add.Checked == true)
            {
                double sum;
                sum = i+j ;
                MessageBox.Show("sum: " + sum);
            }
        }
    }
}
```

```

else if (radioButton_subtract.Checked == true)
{
    double difference;
    difference = i-j;
    MessageBox.Show("difference: " + difference);
}
else if (radioButton_division.Checked == true)
{
    double result;
    try
    {
        // Suspect code
        result = i / j;
        MessageBox.Show("Quotient: " + result);
    }
    catch (DivideByZeroException ex)
    {
        MessageBox.Show("Attempted divide by zero. {0}", ex.Message);
    }
}
else if (radioButton_multiply.Checked == true)
{
    double product;
    product = i * j;
    MessageBox.Show("product: " + product);
}
}
}
}

```
